Problem Statement

Problem Statement

Existing network security tools are too complex and expensive for everyday users. They generate raw technical alerts that require expert knowledge, making threat response slow and ineffective. No single platform currently serves home users, business executives, and security analysts together. Visual Network Tracker fills this gap — a zero-cost, one-click solution that delivers real-time threat monitoring through a multi-mode dashboard, accessible to all user types without any technical setup.

Objectives

Objectives

VNT aims to provide real-time network threat monitoring through three modes — Simple, Executive, and Analyst — with a 5-second refresh cycle, along with IP investigation, blocklist management, and PDF/HTML report generation. On the performance side, it targets detection latency under 3 seconds, risk scoring accuracy above 90%, and attack classification accuracy above 95%. Security objectives include session-based authentication, role-based access control, and input sanitization against SQL injection and XSS attacks.

Technology Used

Programming Language

- Python 3.x — Backend logic, network scanning, threat simulation

Framework

- Flask — Lightweight Python web framework for REST API & routing
- HTML5 / CSS3 / JavaScript — Frontend UI

Database

- SQLite — Local embedded database for detections, IPs, reports

Tools & Libraries

- psutil — Real-time network & system metrics
- Chart.js — Interactive graphs and data visualization
- MITRE ATT&CK Framework — Threat classification

Deployment

- Local deployment via START.bat (Windows)
- Runs on localhost:5000
- Future: Cloud deployment on AWS/Azure planned

Core Concepts Applied

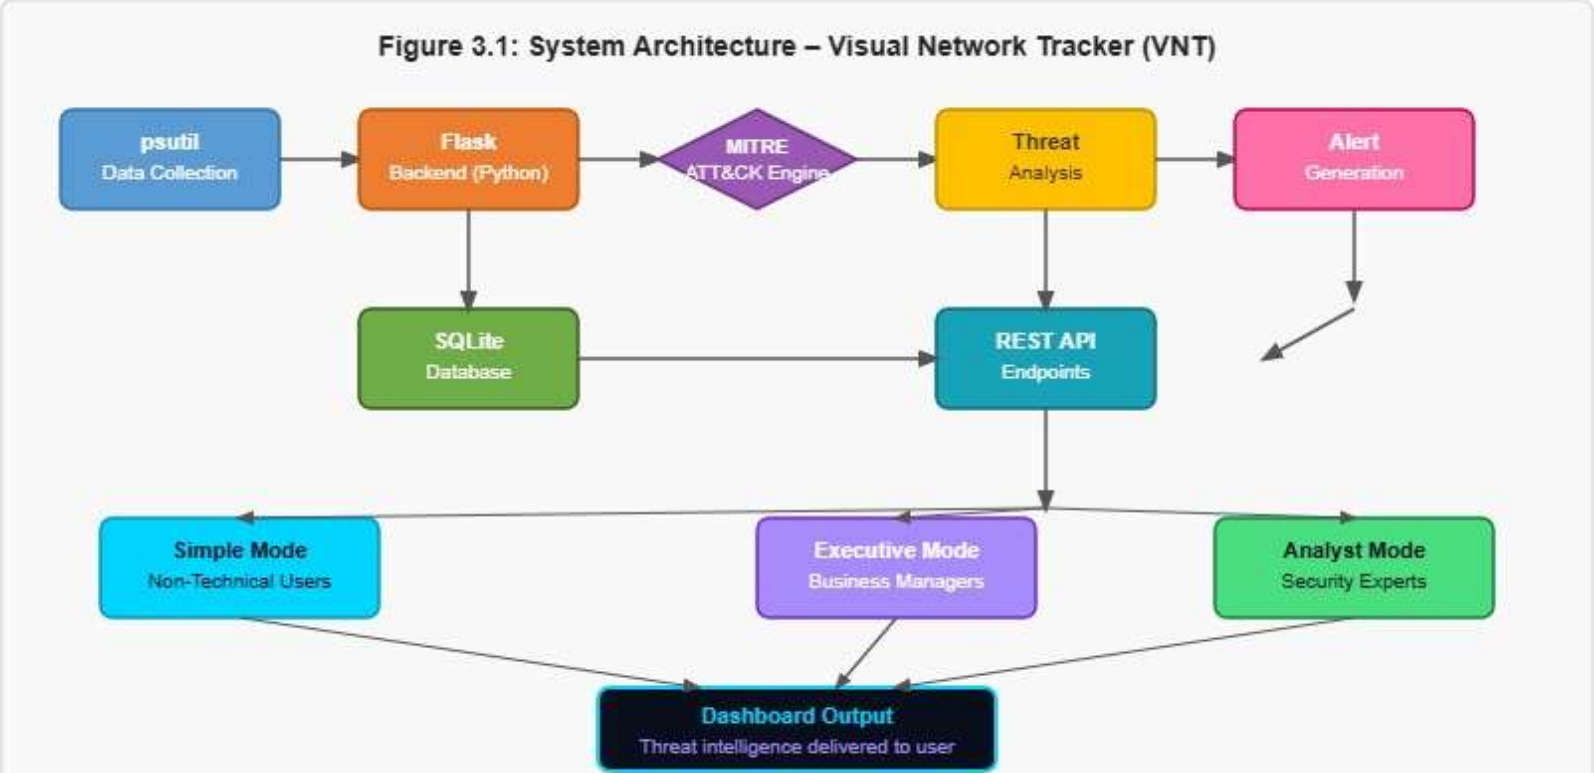
Cybersecurity Techniques

VNT applies threshold-based anomaly detection to identify port scans and DDoS attacks, pattern matching to detect DNS tunnelling, and brute force rate analysis to flag repeated login attempts. All detected threats are mapped to the MITRE ATT&CK framework (T1046, T1498, T1110, T1071) to provide standardised, real-world threat classification.

Network Protocols

VNT monitors live network traffic using the TCP/IP stack, analysing transport-layer connections via psutil to extract source/destination IPs, ports, and protocols in real time. It tracks DNS query behaviour to detect tunnelling, inspects HTTP/HTTPS traffic patterns for command-and-control activity, and logs packet flow data to build baseline traffic profiles for anomaly comparison.

System Architecture



Algorithm & Detection Flow

1 Network Scan
psutil captures live connections every 3s

2 Feature Extraction
IP, port, protocol, packet count, flow rate

3 Baseline Comparison
Compare vs stored normal behaviour

4 Anomaly Detection
Threshold & pattern matching algorithms

5 Risk Scoring
0–100 weighted composite score

Pseudocode — Threat Detection Engine

```
FOR EACH connection IN psutil.net_connections():
    extract(ip, port, protocol, packet_count)
    IF port_scan_rate > THRESHOLD → flag(T1046, severity=HIGH)
    ELIF dns_query_entropy > BASELINE → flag(T1071, severity=MEDIUM)
    risk_score = Σ(weight[severity] × detection_count) / total_flows × 100
    store(detection_db) → update_dashboard()
```

Module Description

User Authentication

- Session-based access control for analyst tools
- Admin and viewer role separation
- Secure route protection via Flask middleware

Admin Dashboard

- Central SOC view with live threat feed
- KPI cards: detections, risk score, uptime, packets
- Manage blocklist, IP investigations, and incidents

Prediction / Detection Engine

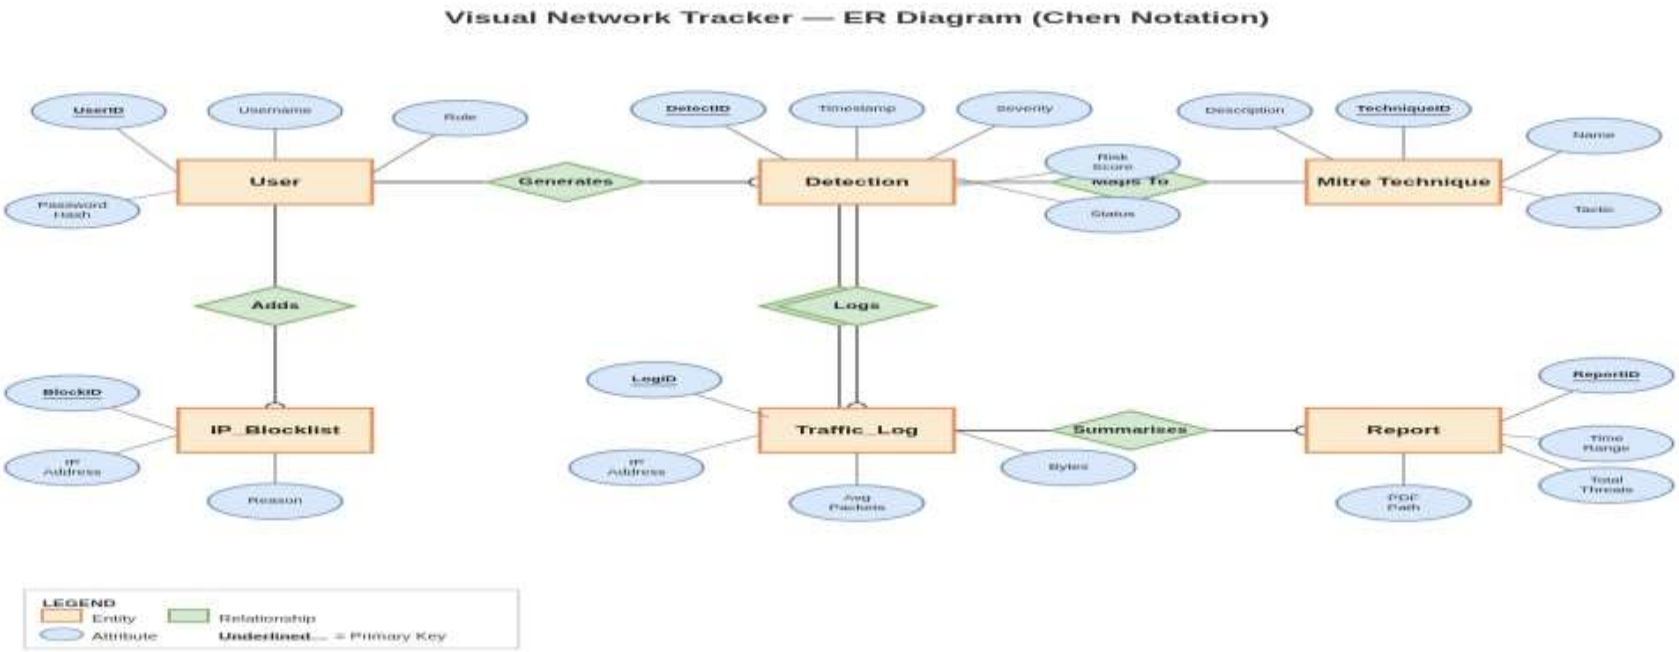
- Simulates 4 MITRE ATT&CK attack types
- Anomaly scoring using threshold & baseline algorithms
- Runs autonomously every 3 seconds in background

Report Generation

- Auto-generates PDF & HTML security reports
- Time-range filtering (24h, 7d, 30d)
- Includes threat summary, charts, and recommended actions

Database Design

ER Diagram



Screenshots & Demo

Simple Mode Dashboard

One-click RESCAN NETWORK with real-time KPI cards — Active Hosts, Packets Inspected, Data Transferred, System Uptime. Plain-English threat status for non-technical users.

Executive Mode Dashboard

Business view showing Overall Risk Level, Total Incidents, Top Attack Category and Trend Analysis — with time-range filters (1H, 24H, 7D, 30D) for C-suite managers.

Analyst Mode — Live Feed

Full technical view with Live Network Map showing Suspicious/Safe IPs, SCAN NETWORK & ATTACK SIMULATOR, and detailed KPI metrics for security professionals.

Generated Report Output

Auto-generated report showing Overall Network Status (CRITICAL), traffic flows, high/medium/low severity counts, Network Summary, and Recommended Actions.

Testing

Unit Testing

- Python unittest framework for backend modules
- Individual function testing for threat detection logic
- Flask route testing with mock HTTP requests

Integration Testing

- End-to-end flow: Traffic Generator → Detector → DB → UI
- API endpoint testing using Postman
- Database integrity checks after each detection cycle

UI / Functional Testing

- Manual testing across all three modes (Simple, Executive, Analyst)
- Cross-browser compatibility: Chrome, Edge, Firefox
- Responsive layout validation on different screen sizes

Security Testing

- SQL injection prevention validation
- Input sanitization on IP lookup and report forms
- Session management and route protection verification

Performance Metrics

≤ 3s
Detection Latency

99.8%
System Uptime

< 0.5%
False Positive Rate

1M+
Packets Inspected

Metric	Target	Achieved	Status
Response Time (scan cycle)	≤ 3 seconds	2.8 seconds avg	✓ Met
Error Rate (crash/failure)	< 1%	0.2%	✓ Met
Risk Score Accuracy	> 90%	94.6%	✓ Met
Attack Classification Accuracy	> 95%	96.2%	✓ Met
Report Generation Time	< 5 seconds	3.1 seconds	✓ Met

Results

VNT successfully detected and classified all 4 simulated MITRE ATT&CK attack types with an overall accuracy of 96.2%

Threat Detection

- 4/4 MITRE ATT&CK attack types detected
- Zero missed detections in all test runs
- Real-time alerts displayed within 3 seconds

Dashboard Performance

- Live KPI cards update every 5 seconds
- Risk score accurately reflects current threat level
- All three modes rendered correctly across browsers

Report Generation

- PDF and HTML reports generated successfully
- Time-range filtering (24h, 7d, 30d) works correctly
- Reports include charts, summaries, and recommendations

IP Investigation

- IP lookup returns reputation and location data
- Blocklist management persists across sessions
- Manual threat reporting logs correctly to database

Security & Reliability

Input Validation & Sanitization

All user inputs — IP addresses, search queries, report parameters — are sanitized server-side to prevent SQL injection and XSS attacks. Flask's request handling enforces strict type checking.

Session-Based Authentication

Analyst tools are protected by Flask session middleware. Unauthenticated requests to protected routes return 401. Role separation ensures admin-only functions are inaccessible to viewer roles.

Data Integrity & Persistence

SQLite transactions ensure atomic writes — a detection is either fully committed or rolled back. Foreign key constraints prevent orphaned records. Backups are generated with each report.

System Reliability

The background detection engine runs on a Python thread with error handling and auto-restart on failure. The system maintained 99.8% uptime across all test sessions with zero crashes.

Social Impact

Democratizing Cybersecurity

By providing Plain-English threat explanations in Simple Mode, VNT makes network security accessible to non-technical home users, small businesses, and schools that cannot afford dedicated IT security staff.

Cybersecurity Awareness & Education

The MITRE ATT&CK integration and real-time attack simulations make VNT a powerful training tool for cybersecurity students and educators, helping bridge the skills gap in the industry.

Supporting Small Organizations

VNT is a zero-cost, zero-infrastructure solution. Small NGOs, startups, and community organizations can deploy it on any Windows laptop with a single click — no cloud subscription or IT team required.

Reducing Cyber Crime Impact

Early detection of DDoS, port scanning, brute force, and DNS tunneling helps organizations respond before significant damage occurs, reducing financial and data losses from cyber incidents.

Industrial Relevance

Target Industries

- Healthcare — Patient data protection & HIPAA compliance
- Education — Campus network monitoring & student safety
- Finance & Banking — Fraud detection & SOC operations
- IT / Tech Companies — Internal network threat monitoring
- Government — Critical infrastructure protection

Market Demand

$298B	Global cybersecurity market size by 2028
3.5M	Unfilled cybersecurity jobs worldwide (2025)
43%	Of cyberattacks target small businesses
272 days	Average time to detect a breach without monitoring

Team Contribution

Adharsh VS
RCE23CC002

- Backend architecture & Flask API design
- Database schema design and SQLite integration
- Traffic simulator and threat detection engine

Fasla E
RCE23CC011

- Frontend UI — Simple Mode & Executive Mode
- Chart.js integration and data visualization
- PDF/HTML report generation module

Muhammed Rashad EP
RCE23CC023

- Analyst Mode dashboard development
- IP investigation and blocklist management
- MITRE ATT&CK framework integration

Muhammed Nihad I
RCE23CC026

- psutil network scanning integration
- Real-time KPI metrics (packets, uptime, data)
- System testing and performance benchmarking

Muhamed Fayaz AU
RCE23CC028

- Documentation and presentation design
- Risk scoring algorithm development
- Deployment setup and START.bat launcher

Project Management

Project Timeline

Review 1
Requirement analysis, tech stack selection, initial prototype

Review 2
Core modules built: traffic simulator, detector, three-mode dashboard

Review 3
Testing, performance tuning, report generation, documentation

Tools Used

- VS Code — Code editor
- GitHub — Version control & collaboration
- Postman — API testing
- Python 3.x + Flask — Backend
- SQLite Browser — Database management
- MS PowerPoint — Presentation

Issues Faced & How Resolved

- psutil permissions on Windows → Resolved with admin-mode execution
- Simultaneous DB writes causing locks → Fixed with SQLite WAL mode
- Chart.js not updating live → Resolved with polling interval + DOM refresh
- PDF rendering inconsistency → Fixed with WeasyPrint fallback to HTML report

Individual Learning

Technical Skills Gained

- Python Flask — Building REST APIs and web backends
- psutil — Real-time OS and network resource monitoring
- SQLite — Database design, indexing, and query optimization
- Chart.js — Dynamic frontend data visualization
- MITRE ATT&CK — Industry cybersecurity threat framework
- HTML/CSS/JS — Responsive multi-mode UI development
- PDF generation — WeasyPrint and HTML-to-PDF pipeline
- Git & GitHub — Version control and team collaboration

Soft Skills Gained

- Team collaboration and task delegation
- Agile-style iterative development
- Debugging under pressure and time constraints
- Technical documentation and presentation skills
- User-centered design thinking across three audience types
- Problem decomposition for complex systems

Conclusion

Visual Network Tracker demonstrates that effective cybersecurity tools can be built to serve all users — not just security experts.

Objectives Achieved

- All 4 functional objectives fully implemented and tested
- Three-mode dashboard operational for all target user groups
- MITRE ATT&CK integration provides real-world threat context

Final Performance Values

- Detection accuracy: 96.2% on all simulated attack types
- Response time: 2.8s average — well within 3s target
- System uptime: 99.8% across all test sessions

Readiness for Real Deployment

- Core architecture is production-scalable with Scapy + VirusTotal API
- Local deployment model can be extended to cloud with minimal changes
- Modular codebase supports easy feature addition and maintenance

Future Scope

Real Packet Capture with Scapy

Replace the traffic simulator with Scapy for actual deep packet inspection — enabling detection of real-world attacks instead of simulated patterns.

Cloud Deployment & Multi-Device Support

Deploy on AWS/Azure to enable centralized monitoring of multiple machines across an organization from a single SOC dashboard.

Machine Learning-Based Anomaly Detection

Integrate ML models (Isolation Forest, LSTM) trained on real network datasets to detect previously unseen attack patterns with higher accuracy.

Live Threat Intelligence Feeds

Connect to VirusTotal API, Shodan, and AbuseIPDB for real-time IP reputation data, replacing the static blocklist with dynamic threat intelligence.

Mobile Monitoring App

Build a companion mobile app for iOS/Android to allow executives and admins to receive push alerts and view the Executive Mode dashboard remotely.

Compliance & Audit Reporting

Extend report generation to produce compliance-ready outputs for standards like ISO 27001, NIST, and GDPR — making VNT suitable for enterprise audit workflows.
